

数学物理方法 2

第二次作业

1.

(1) 证明: $\delta(x - x_0)\delta(y - y_0)\delta(z - z_0) = \frac{1}{r^2}\delta(r - r_0)\delta(\cos\theta - \cos\theta_0)\delta(\varphi - \varphi_0)$.

证明. 注意到我们只需证明 $\forall f: R^3 \rightarrow R, \forall r_0, \theta_0, \varphi_0$,

$\int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} f(r, \theta, \varphi) \frac{1}{r^2} \delta(r - r_0) \delta(\cos\theta - \cos\theta_0) \delta(\varphi - \varphi_0) dx dy dz = f(r_0, \theta_0, \varphi_0)$ 即可 (即我们证明了待证等式两端的算子对函数空间内所有函数的作用都是相同的, 这是泛函中分布的观点, 事实上 δ 函数就是这么定义的).

由坐标变换关系 $x = x(r, \theta, \varphi), y = y(r, \theta, \varphi), z = z(r, \theta, \varphi), dx dy dz = \frac{\partial(x, y, z)}{\partial(r, \theta, \varphi)} dr d\theta d\varphi$, 其中 $\frac{\partial(x, y, z)}{\partial(r, \theta, \varphi)}$ 是

$x(r, \theta, \varphi), y(r, \theta, \varphi), z(r, \theta, \varphi)$ 的 Jacobian 行列式. 由计算可得 $\frac{\partial(x, y, z)}{\partial(r, \theta, \varphi)} = r^2 \sin\theta$. 因此将变换后的微分形式代入待证式可得:

$$\int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} \int_{-\infty}^{+\infty} f(r, \theta, \varphi) \frac{1}{r^2} \delta(r - r_0) \delta(\cos\theta - \cos\theta_0) \delta(\varphi - \varphi_0) dx dy dz = \int_0^{+\infty} \int_0^\pi \int_0^{2\pi} f(r, \theta, \varphi) \sin\theta \delta(r - r_0) \delta(\cos\theta - \cos\theta_0) \delta(\varphi - \varphi_0) dr d\theta d\varphi.$$

事实上由 δ 函数定义我们可以得到如下关系:

$$\begin{aligned} \int_0^{+\infty} f(r, \theta, \varphi) \delta(r - r_0) dr &= f(r_0, \theta, \varphi) \\ \int_{-1}^1 f(r, \theta, \varphi) \delta(\cos\theta - \cos\theta_0) d(\cos\theta) &= \int_0^\pi f(r, \theta, \varphi) \delta(\cos\theta - \cos\theta_0) \sin\theta d\theta = f(r, \theta_0, \varphi) \\ \int_0^{2\pi} f(r, \theta, \varphi) \delta(\varphi - \varphi_0) d\varphi &= f(r, \theta, \varphi_0) \end{aligned}$$

由 Fubini 定理:

$$\int_0^{+\infty} \int_0^\pi \int_0^{2\pi} f(r, \theta, \varphi) \sin\theta \delta(r - r_0) \delta(\cos\theta - \cos\theta_0) \delta(\varphi - \varphi_0) dr d\theta d\varphi = \int_0^{+\infty} \int_0^\pi f(r, \theta, \varphi_0) \sin\theta d\theta dr = \int_0^{+\infty} f(r, \theta_0, \varphi_0) dr = f(r_0, \theta_0, \varphi_0)$$

我们证明了原命题. □

(2) 证明: $\nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} = -4\pi \delta(\vec{r} - \vec{r}_0)$.

若想证明 $\nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} = -4\pi \delta(\vec{r} - \vec{r}_0)$, 我们只需证明 $\forall f \in L(R^3), \int_\Omega f(\vec{r}) \nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} dV = -4\pi f(\vec{r}_0)$.

其中 Ω 是任意包含 $\vec{r}_0$ 的区域. 记 $\vec{r} - \vec{r}_0 = \vec{x} + \vec{y} + \vec{z}$. 我们将积分区域分成两部分, $B(\vec{r}_0, \delta)$ 和 $\Omega \setminus B(\vec{r}_0, \delta)$. 注意到 $\forall \vec{r} \in \Omega \setminus B(\vec{r}_0, \delta), \nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} = \nabla \cdot \left(-\frac{\vec{r} - \vec{r}_0}{|\vec{r} - \vec{r}_0|^3} \right) = -\frac{3x^2 - |\vec{r} - \vec{r}_0|^2 + 3y^2 - |\vec{r} - \vec{r}_0|^2 + 3z^2 - |\vec{r} - \vec{r}_0|^2}{|\vec{r} - \vec{r}_0|^5} =$

0.

因此 $\int_{\Omega \setminus B(\vec{r}_0, \delta)} f \nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} dV = 0$. 现在考虑 $\int_{B(\vec{r}_0, \delta)} f(\vec{r}) \nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} dV$. 由格林第一公式,

$$\int_{B(\vec{r}_0, \delta)} f(\vec{r}) \nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} dV = \int_{\partial B(\vec{r}_0, \delta)} f(\vec{r}) \nabla \frac{1}{|\vec{r} - \vec{r}_0|} \cdot \vec{dS} - \int_{B(\vec{r}_0, \delta)} \nabla f(\vec{r}) \cdot \nabla \frac{1}{|\vec{r} - \vec{r}_0|} dV =$$

$$\int_{\partial B(\vec{r}_0, \delta)} f(\vec{r}) \frac{-(\vec{r} - \vec{r}_0)}{|\vec{r} - \vec{r}_0|^3} \cdot \vec{dS} - \int_{B(\vec{r}_0, \delta)} \frac{x f_x + y f_y + z f_z}{|\vec{r} - \vec{r}_0|^3} dV = - \int_{\partial B(\vec{r}_0, \delta)} f(\vec{r}) d\Omega - \int_{B(\vec{r}_0, \delta)} \frac{x f_x + y f_y + z f_z}{|\vec{r} - \vec{r}_0|} dr d\Omega$$
如果 f 的各一阶偏导有界 M , 则由柯西不等式,

$$x f_x + y f_y + z f_z \leq M(x + y + z) \leq \frac{M}{3} \sqrt{(1^2 + 1^2 + 1^2)(x^2 + y^2 + z^2)} = \frac{M}{\sqrt{3}} |\vec{r} - \vec{r}_0|.$$

因此 $|\int_{B(\vec{r}_0, \delta)} \frac{x f_x + y f_y + z f_z}{|\vec{r} - \vec{r}_0|} dr d\Omega| \leq \frac{4\pi M}{\sqrt{3}} \delta \rightarrow 0$ 当 $\delta \rightarrow 0$.

因此 $\int_{\Omega} f(\vec{r}) \nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} dV = \lim_{\delta \rightarrow 0} (\int_{\Omega \setminus B(\vec{r}_0, \delta)} f(\vec{r}) \nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} dV + \int_{B(\vec{r}_0, \delta)} f(\vec{r}) \nabla^2 \frac{1}{|\vec{r} - \vec{r}_0|} dV)$
 $= 0 - \lim_{\delta \rightarrow 0} \int_{\partial B(\vec{r}_0, \delta)} f(\vec{r}) d\Omega = -4\pi f(\vec{r}_0)$. 因此我们证明了原命题.

2. 证明以下傅里叶变换关系

$$(1): \int_{-\infty}^{+\infty} \frac{\cos \omega t}{\omega^2 + a^2} d\omega = \frac{\pi}{a} e^{-a|t|}$$

考虑 $e^{-a|t|}$ 的傅里叶正变换. $\int_{-\infty}^{+\infty} e^{-a|t|} e^{-i\omega t} dt = \int_{-\infty}^0 e^{at-i\omega t} dt + \int_0^{+\infty} e^{-at-i\omega t} dt = \frac{1}{a-i\omega} - \frac{1}{-a-i\omega} =$
 $\frac{2a}{a^2 + \omega^2}$

因此由傅里叶逆变换公式, $\frac{1}{2\pi} \int_{-\infty}^{+\infty} \frac{2a}{a^2 + \omega^2} e^{i\omega t} d\omega = e^{-a|t|} \implies \int_{-\infty}^{+\infty} \frac{e^{i\omega t}}{a^2 + \omega^2} d\omega = \frac{\pi}{a} e^{-a|t|}$

然后只需注意到 $Re(\int_{-\infty}^{+\infty} \frac{e^{i\omega t}}{a^2 + \omega^2} d\omega) = \int_{-\infty}^{+\infty} Re(\frac{e^{i\omega t}}{a^2 + \omega^2}) d\omega$ 即可得到原式.

$$(2): \text{设 } r = \sqrt{x^2 + y^2 + z^2}, k = \sqrt{k_1^2 + k_2^2 + k_3^2}$$

$$(i): F[\frac{1}{r}] = \sqrt{\frac{2}{\pi}} \frac{1}{k^2}$$

欲证上述等式, 我们可以考虑在傅里叶逆变换等式两端同时作用上拉普拉斯算子, 即:

$$\nabla^2(\frac{1}{r}) = \nabla^2((\frac{1}{2\pi})^{3/2} \int \sqrt{\frac{2}{\pi}} \frac{1}{k^2} e^{i\vec{k} \cdot \vec{r}} dV)$$

容易证明 $\nabla^2(e^{i\vec{k} \cdot \vec{r}}) = -k^2 e^{i\vec{k} \cdot \vec{r}}$. 因此原式变为 $\nabla^2(\frac{1}{r}) = -\frac{1}{2\pi^2} \int e^{i\vec{k} \cdot \vec{r}} dV$. 而我们已经证明 $\nabla^2(\frac{1}{r}) =$
 $-4\pi \delta(\vec{r})$

因此原命题等价于: $F[-4\pi \delta(\vec{r})] = -\sqrt{\frac{2}{\pi}}$. 而这显然是正确的.

因为 $F[-4\pi \delta(\vec{r})] = -4\pi (\frac{1}{2\pi})^{3/2} \int \delta(\vec{r}) e^{-i\vec{k} \cdot \vec{r}} dV = -4\pi (\frac{1}{2\pi})^{3/2} = -\sqrt{\frac{2}{\pi}}$. 证毕.

$$(ii): F[\frac{\sin(ak)}{k}] = \sqrt{\frac{2}{\pi}} \frac{\delta(r-a)}{r} \iff \frac{\sin(ak)}{k} = F[\sqrt{\frac{\pi}{2}} \frac{\delta(r-a)}{r}]$$

欲证上述等式, 我们考虑在等式两侧同时乘以 $e^{-\mu a} (\mu > 0)$ 并关于 a 积分:

$$\text{左侧: } \int_0^{+\infty} e^{-\mu a} \frac{\sin(ak)}{k} da = (\frac{1}{ik + \mu} - \frac{1}{\mu - ik}) \frac{1}{k}.$$

$$\text{右侧: } \int_0^{+\infty} e^{-\mu a} (\frac{1}{2\pi})^{3/2} \int \frac{\sqrt{\frac{\pi}{2}} \delta(r-a)}{r} e^{-i\vec{k} \cdot \vec{r}} dV = (\frac{1}{2\pi})^{3/2} \int \frac{e^{-\mu r}}{r} e^{-i\vec{k} \cdot \vec{r}} dV$$

此时再让 $\mu \rightarrow 0$, 我们得到两侧分别为 $\frac{1}{k^2}$ 和 $F[\sqrt{\frac{\pi}{2}} \frac{1}{r}]$. 由 (i) 我们知道两者是相等的. 因此原命题得证.

3.

只需注意到 $F(p) = \int_0^{+\infty} f(t) e^{-pt} dt = \sum_{n=0}^{+\infty} \int_0^a f(t+na) e^{-p(t+na)} dt$ (由周期性) $= \sum_{n=0}^{+\infty} e^{-pna} \int_0^a f(t) e^{-pt} dt$
 (由等比数列求和) $= \frac{1}{1-e^{-pa}} \int_0^a f(t) e^{-pt} dt$. 证毕.

4.

设绳的质量线密度为 λ , 横向振幅 $u(r, t)$. 考虑一段微元 $r \sim r + dr$ 上的水平方向受力平衡 (在以 ω 角速度旋转的非惯性系下), 即可得 $T(r) - T(r + dr) = \lambda dr \omega^2 r \implies T(r) = T_0 - \frac{1}{2} \lambda \omega^2 r^2$.

考虑该微元竖直方向的运动方程: $\lambda dr u_{tt}(r, t) = T(r + dr) u_r(r + dr, t) - T(r) u_r(r, t) \implies \lambda u_{tt}(r, t) = -\lambda \omega^2 r u_r(r, t) + (T_0 - \frac{1}{2} \lambda \omega^2 r^2) u_{rr}(r, t)$. 即为所求波动方程.

5.

考虑边界上一个小微元的热量流入. 对于 $x = 0$ 处的微元, 左侧热量流入是 $q_0 S$, 右侧流出能量是 $q(0) = -k T_x(x, t)$. 由于微元可以取任意小 (即热容可以取任意小), $q_0 S$ 不是小量, 因此要求流入流出热量相等 $\implies q_0 S = -k T_x(x, t) \implies T_x(x, t)|_{x=0} = -\frac{q_0 S}{k}$. 这是第二类边界条件. 对于 $x = l$ 处的微元同理有 $T_x(x, t)|_{x=l} = \frac{q_0 S}{k}$. 两者构成边界条件.

6.

控制方程: $u_{tt}(x, t) = a^2 u_{xx}(x, t) \quad 0 \leq x \leq l, t > 0$

边界条件: $u(x, t)|_{x=0} = 0, u(x, t)|_{x=l} = 0$

初始条件: 由各点的竖直方向受力平衡, 容易得到: $F_o = T \sin \alpha_1, F_c = T \sin \alpha_1 + T \sin \alpha_2, F_l = T \sin \alpha_2$. 由几何关系: $c \tan \alpha_1 = (l - c) \tan \alpha_2$.

综上可以解得: $\alpha_1 = \arccos(\sqrt{\frac{c^2}{2cl - l^2}(1 - (\frac{F_o}{F_l})^2)})$, $\alpha_2 = \arccos(\sqrt{\frac{(l-c)^2}{2cl - l^2}((\frac{F_l}{F_o})^2 - 1)})$. 因此初始条件为: $u(x, t)|_{t=0} = \begin{cases} x \sqrt{\frac{2cl - l^2}{c^2} \frac{F_l^2}{F_o^2 - F_l^2} - 1} & 0 < x < c \\ \sqrt{(2cl - l^2) \frac{F_l^2}{F_o^2 - F_l^2} - c^2} - (x - c) \sqrt{\frac{2cl - l^2}{(l-c)^2} \frac{F_o^2}{F_o^2 - F_l^2} - 1} & c \leq x \leq l \end{cases}, u_t(x, t)|_{t=0} = 0$

以上三者构成定解问题.

7.

由非齐次波动方程的达朗贝尔公式, 解为:

$$\begin{aligned} u(x, t) &= \frac{1}{2}(e^{-2(x-at)^2} + e^{-2(x+at)^2}) + \frac{1}{2a} \int_{x-at}^{x+at} \sin l dl + \frac{1}{2a} \int_0^t \int_{x-a(t-\tau)}^{x+a(t-\tau)} \cos l \cos(\omega \tau) dl d\tau \\ &= \frac{1}{2}(e^{-2(x-at)^2} + e^{-2(x+at)^2}) + \frac{1}{2a}(\cos(x - at) - \cos(x + at)) + \frac{1}{4a}(\frac{1}{\omega - a}(\sin(x + \omega t) - \sin(x + at) + \sin(x - \omega t) - \sin(x - at)) + \frac{1}{\omega + a}(\sin(x + at) - \sin(x - \omega t) + \sin(x - at) - \sin(x + \omega t))) \end{aligned}$$

8.

对该半无界问题做奇延拓, 并由达朗贝尔公式可得:

$$u(x, t) = \frac{1}{2}(\sin(x + at) - \sin(at - x)) = \frac{1}{2}(\sin(x + at) + \sin(x - at)) = \cos(at) \sin(x)$$

以下是 7 个时间点的振动情况:

图 1: $t=0$

图 2: $t = \frac{\pi}{3a}$

图 3: $t = \frac{2\pi}{3a}$

图 4: $t = \frac{3\pi}{3a}$

图 5: $t = \frac{4\pi}{3a}$

图 6: $t = \frac{5\pi}{3a}$

图 7: $t = \frac{6\pi}{3a}$
